

AZ-140

Configure and Operate
Azure Virtual Desktop

[Install and configure apps
on a session host](#)

AZ-140 Agenda

Learning Path 1

1. Azure Virtual Desktop Architecture
2. Design the Azure Virtual Desktop architecture
3. Design for user identities and profiles

Learning Path 2

4. Implement and manage networking for AVD
5. Implement and manage storage for AVD
6. Create and configure host pools and session hosts for AVD
7. Create and manage session host image for AVD

Learning Path 3

8. Manage access for AVD
9. Manage security for AVD

Learning Path 4

10. Implement and manage FSLogix
11. Configure user experience settings
12. Install and configure apps on a session host

Learning Path 5

13. Monitor and manage performance and health
14. Plan and implement updates, backups, and disaster recovery

Introduction

After completing this module, you'll be able to:

- Describe MSIX app attach for Azure Virtual Desktop.
- Explain how MSIX app attach works.
- Set up a file share for MSIX app attach.
- Use the OneDrive sync app on Azure Virtual Desktops.
- Use Microsoft Teams on Azure Virtual Desktop.
- Publish built-in apps in Azure Virtual Desktop.

Create and configure an application group

Install and configure apps on a session host

Create and configure an application group

There are two ways to make applications available to users in Azure Virtual Desktop:

- **Part of a full desktop.**
- **Individual applications with RemoteApp.**
 - You publish applications by adding them to an application group, which is associated with a host pool and workspace, and assigned to users.

For desktop application groups: Publish a full desktop and all applications in MSIX packages using MSIX app attach to appear in the user's start menu in a desktop session.

- If you use app attach, applications aren't added to a desktop application group.

For RemoteApp application groups: Publish applications to stream remotely that are installed locally on session hosts.

- Or, delivered dynamically using app attach and MSIX app attach and presented to users as individual applications in one of the supported Remote Desktop clients.

Assign users to application groups

Install and configure apps on a session host

Assign users to application groups

To assign users or user groups to an application group to a workspace using the Azure portal.

- From the Azure Virtual Desktop overview, select **Application groups**.
- Select the application group from the list.
- From the application group overview, select **Assignments**.
- Select **+ Add**, then search for and select the user account or user group you want to assign to this application group.
- Finish by selecting **Select**.

Publish an application as a RemoteApp

Install and configure apps on a session host

Publish an application as a RemoteApp

You can customize RemoteApp and remote desktop resources to appear in a recognizable way for your users.

Below is how to customize the display name for a published RemoteApp or desktop using the Azure portal.

- Sign in to the Azure portal.
- Search for **Azure Virtual Desktop**.
- Under **Services**, select **Azure Virtual Desktop**.
- On the **Azure Virtual Desktop** page, select **Application groups** on the left side of the screen, then select the name of the application group you want to edit.
- Select **Applications** in the menu on the left side of the screen.
- Select the application you want to update, then enter a new **Display name**.
- Select **Save**. The application you edited should now display the updated name. Users see the new name once their client refreshes.

Implement and manage OneDrive, including multisession environments

Install and configure apps on a session host

Implement and manage OneDrive

The OneDrive sync app installs per-user, so you install the app for each user on a machine.

You only need to install the app once on a PC.

- This option is useful for computers with multiple users and for when you don't want executable files running from a user profile.

To verify that you have the per-machine installation, you can use the following registry detection rule in Configuration Manager:

Field	Value
Hive	HKEY_LOCAL_MACHINE
Key	SOFTWARE\Microsoft\OneDrive
Name	Version
32-bit on 64-bit	TRUE
Type	REG_SZ
Value	19.043.0304.0007

Implement and manage Microsoft Teams for Remote Desktop

Install and configure apps on a session host

Implement and manage Microsoft Teams for Remote Desktop

Microsoft Teams on Azure Virtual Desktop supports chat and collaboration.

- Using *media optimizations*, Azure Virtual Desktop supports calling and meeting functionality by redirecting it to the local device when using Windows App or the Remote Desktop client on a supported platform.
- You can use Microsoft Teams on Azure Virtual Desktop on other platforms without optimized calling and meetings.
 - Teams chat and collaboration features are supported on all platforms.

There are two versions of Teams, and you can use either with Azure Virtual Desktop. :

Classic Teams: Legacy free Teams app for business (Retired April 12, 2023)

New Teams: Feature parity with Classic Teams, but improves performance, reliability, and security.

Implement and manage Microsoft 365 Apps on Azure Virtual Desktop session hosts

Install and configure apps on a session host

Implement and manage Microsoft 365 Apps on Azure Virtual Desktop session hosts

If you use Remote Desktop Services (RDS), you can install Microsoft 365 Apps on those computers.

NOTE: You must use the Office Deployment Tool and enable shared computer activation to do the installation.

The following are two common RDS scenarios:

- Install Microsoft 365 Apps on an RDS server.
- Install Microsoft 365 Apps on a shared virtual machine.

Prerequisites for deploying Microsoft 365 Apps or the Project and Visio desktop apps with RDS:

- One of the following plans:
 - A Microsoft 365 (or Office 365) plan that includes Microsoft 365 Apps for enterprise.
 - A Microsoft 365 Business Premium plan that includes Microsoft 365 Apps for business.
 - For the Project and Visio desktop apps, a subscription plan that includes those products.
- The Office Deployment Tool (available on the Microsoft Download Center).
- A separate user account for each user who signs in to the shared computer.
- An eligible license assigned to each user account.
- A version of Windows listed in the Microsoft 365 plans for business, education, and government system requirements.

Configure dynamic application delivery by using app attach or MSIX app attach

Install and configure apps on a session host

Configure dynamic application delivery by using app attach or MSIX app attach

App attach enables you to dynamically attach applications from an application package to a user session in Azure Virtual Desktop.

To use app attach in Azure Virtual Desktop, you need the following:

- Existing host pool with session hosts, an application group, and a workspace.
- Session hosts need to run a supported Windows client operating system and at least one of them must be powered on. Windows Server isn't supported.
- Host pool needs to be configured as a validation environment.
- Session hosts need to be joined to Microsoft Entra ID or an Active Directory Domain Services (AD DS) domain.
- An SMB file share in the same Azure region as your session hosts
- To use Azure Files when your session hosts joined to Microsoft Entra ID, you need to assign the Reader and Data Access Azure role-based access control (RBAC) role to both the Azure Virtual Desktop and Azure Virtual Desktop ARM Provider service principals.
- An MSIX or Appx disk image that you created from an application package and stored on the file share.
- To add MSIX images, you need the Desktop Virtualization Contributor Azure role-based access control (RBAC) role assigned on the resource group as a minimum.

Create an application package for app attach or MSIX app attach

Install and configure apps on a session host

How a user gets an application

Two features in Azure Virtual Desktop that enable you to dynamically attach applications from an application package to a user session in Azure Virtual Desktop:

- App attach
- MSIX app attach

Both app attach and MSIX app attach, applications aren't installed locally on session hosts or images, making it easier to create custom images for your session hosts, and reducing operational overhead and costs for your organization. Applications run within containers, which separate user data, the operating system, and other applications, increasing security and making them easier to troubleshoot.

MSIX app attach vs App attach

MSIX app attach	App attach
Applications are delivered using RemoteApp or as part of a desktop session. Permissions are controlled by assignment to application groups. Desktop users see all MSIX app attach applications in the desktop application group.	Applications are delivered using RemoteApp or as part of a desktop session. Permissions are applied per application per user, giving you greater control over which applications your users can access in a remote session. Desktop users only see the app attach applications assigned to them.
Applications might only run on one host pool. If you want it to run on another host pool, you must create another package.	The same application package can be used across multiple host pools.
Applications can only run on the host pool in which they're added.	Applications can run on any session host running a Windows client operating system in the same Azure region as the application package.
To update the application, you must delete and recreate the application with another version of the package. You should update the application in a maintenance window.	Applications can be upgraded to a new application version with a new disk image without the need for a maintenance window.
Users can't run two versions of the same application on the same session host.	Users can run two versions of the same application concurrently on the same session host.
Telemetry for usage and health is now available through Azure Log Analytics.	Telemetry for usage and health is available through Azure Log Analytics.

Knowledge check

Install and configure apps on a session host

Knowledge check

A system administrator needs to add an MSIX or Appx image as an app attach package using the Azure portal. What is the correct sequence of steps to accomplish this task?

Choices:

1. Sign in to the Azure portal, search for Azure Virtual Desktop, select App attach, complete the Basics tab, select Next, complete the Image path tab, and finally assign the app attach package to host pools, users and groups.
2. Sign in to the Azure portal, select App attach, complete the Basics tab, select Next, complete the Image path tab, and finally assign the app attach package to host pools, users and groups.
3. Sign in to the Azure portal, search for Azure Virtual Desktop, select the matching service entry, select App attach, complete the Basics tab, select Next, complete the Image path tab, and finally assign the app attach package to host pools, users and groups.

Knowledge check

A team member is tasked with sharing an application to a different user in the organization using Azure Virtual Desktop. They need to create a RemoteApp application group and assign it to the user. What should they do to verify that the application has been successfully shared?

Choices:

1. Check the Azure portal for a confirmation message
2. Ask the user to check their email for a confirmation message
3. Have the user sign in to the Azure Virtual Desktop web client and check if the application appears in their workspace

Knowledge check

A system administrator is tasked with setting up the MSIX app attach file share. What permissions are required for session host VMs to access the file share?

Choices:

1. Full control permissions
2. Write permissions
3. Read and Execute, Read, List folder contents permissions

Knowledge check

A team is assigned to manage an application group in the Azure Virtual Desktop. What is the correct procedure to assign users or user groups to this application group using the Azure portal?

Choices:

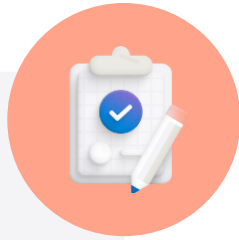

1. From the Azure Virtual Desktop overview, select Application groups. Select the user account or user group from the list, then assign them to the application group.
2. From the Azure Virtual Desktop overview, select Users. Search for and select the user account or user group, then assign them to the application group.
3. From the Azure Virtual Desktop overview, select Application groups. Select the application group from the list. From the application group overview, select Assignments. Select Add, then search for and select the user account or user group to assign to this application group. Finish by selecting Select.

Summary

Install and configure apps on a session host

Summary

What you learned:

- Describe MSIX app attach for Azure Virtual Desktop.
- Explain how MSIX app attach works.
- Set up a file share for MSIX app attach.
- Use the OneDrive sync app on Azure Virtual Desktops.
- Use Microsoft Teams on Azure Virtual Desktop.
- Publish built-in apps in Azure Virtual Desktop.
